

Empirical CDF over the dev queries; higher and further left is better. Queries whose candidate window contains no relevant chunk are NOT drawn at rank 0 -- they are unreachable by any reranker and simply never reach the curve, which is why every line plateaus below 1.0. Unreachable queries per method -- original_ranking@10: 10; metadata_rule_rerank@10: 10; bge_v2m3_structq@10: 10; fuse_rules_first@10: 10; fuse_bge_first@10: 10 (of 238 queries). The per-query files keep the top 10 only, so the curve stops at rank 10.
