

Where 'fuse_bge_first@10' moved the first relevant chunk

All queries, accounted for

'Before' is the rank of the first relevant chunk in the first-stage list, clamped to the top-10 reranking window: a gold chunk that sat deeper than 10 was never shown to the reranker, so it starts in the >10 band instead of being scored as a regression the reranker caused. Only queries whose rank changed are drawn; the right panel accounts for every query, including the unchanged majority.
